# WATER SUPPLY OUTLOOK FOR IDAHO

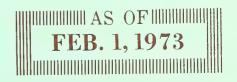

Prepared by

# U. S. DEPARTMENT of AGRICULTURE \* SOIL CONSERVATION SERVICE

Collaborating with

IDAHO STATE DEPARTMENT OF WATER ADMINISTRATION

Data included in this report were obtained by the agencies named above in cooperation with Federal, State and private organizations listed inside the back cover of this report.

### TO RECIPIENTS OF WATER SUPPLY OUTLOOK REPORTS:

Most of the usable water in western states originates as mountain snowfall. This snowfall accumulates during the winter and spring, several months before the snow melts and appears as streamflow. Since the runoff from precipitation as snow is delayed, estimates of snowmelt runoff can be made well in advance of its occurrence. Streamflow forecasts published in this report are based principally on measurement of the water equivalent of the mountain snowpack.

Forecasts become more accurate as more of the data affecting runoff are measured. All forecasts assume that climatic factors during the remainder of the snow accumulation and melt season will interact with a resultant average effect on runoff. Early season forecasts are therefore subject to a greater change than those made on later dates.

The snow course measurement is obtained by sampling snow depth and water equivalent at surveyed and marked locations in mountain areas. A total of about ten samples are taken at each location. The average of these are reported as snow depth and water equivalent. These measurements are repeated in the same location near the same dates each year.

Snow surveys are made monthly or semi-monthly from January 1 through June 1 in most states. There are about 1900 snow courses in Western United States and in the Columbia Basin in British Columbia. Networks of automatic snow water equivalent and related data sensing devices, along with radio telemetry are expanding and will provide a continuous record of snow water and other parameters at key locations.

Detailed data on snow course and soil moisture measurements are presented in state and local reports. Other data on reservoir storage, summaries of precipitation, current streamflow, and soil moisture conditions at valley elevations are also included. The report for Western United States presents a broad picture of water supply outlook conditions, including selected streamflow forecasts, summary of snow accumulation to date, and storage in larger reservoirs.

Snow survey and soil moisture data for the period of record are published by the Soil Conservation Service by states about every five years. Data for the current year is summarized in a West-wide basic data summary and published about October 1 of each year.

### PUBLISHED BY SOIL CONSERVATION SERVICE

The Soil Conservation Service publishes reports following the principal snow survey dates from January 1 through June 1 in cooperation with state water administrators, agricultural experiment stations and others. Copies of the reports for Western United States and all state reports may be obtained from Soil Conservation Service, Western Regional Technical Service Center, Room 209, 511 N. W. Broadway, Portland, Oregon 97209.

Copies of state and local reports may also be obtained from state offices of the Soil Conservation Service in the following states:

# WATER SUPPLY OUTLOOK for IDAHO

# GENERAL SUMMARY FOR FEBRUARY 1, 1973

Snowfall has been extremely variable throughout the state thus far in the 1972-73 season. Snow accumulation as of February 1 varies from a low of 24% of normal on the Palouse River watershed to a high of 176% of average on the Malad River drainage. The snowpack on all watersheds south of the Snake River is above normal while the northern tributaries south of the Clearwater drainage range from below to near average. Snowpack on the northern Idaho watersheds from the Clearwater to the Priest River range from extremely low to well below normal.

Soil moisture in general is lower than normal in all areas. Fall and winter valley precipitation, as reported by selected stations, indicate below normal precipitation on all drainages throughout the state. The one exception is the Owyhee which reported slightly above average.

Carryover reservoir storage is good to excellent in all major irrigation reservoirs. Contents in Oakley and Salmon Falls Reservoirs are at an all-time record for February 1.

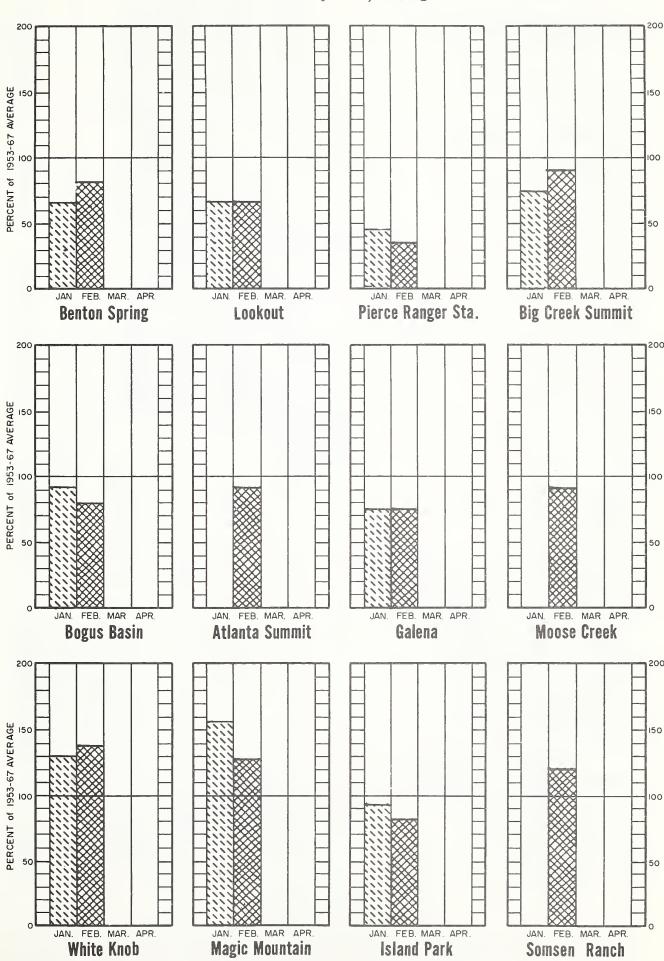

Forecasts of prospective streamflow for the April-September period range from a low of 70% of average for the Spokane River at Post Falls

to a high of 107% of normal for the inflow to Lake Owyhee. Except for small, low elevation streams and watersheds with no storage facilities, which could experience a shortage, the water supply outlook is forecast to be adequate for the 1973 irrigation season. Climatic conditions during the remainder of the winter will have great bearing on seasonal water supplies throughout the state.
